

Julia Furness Rubio - Richfield Senior High Before/After Mission Statements

"My mission is to ease lives by coordinating personal and business events, meetings, or conventions. "

"My mission **now** is to better the lives of others with a greater understanding of skills such as communication, organization, and action"

What did I learn?

The most important skills I learned this course include communication and time management. Organization is key when you work with code whether it is to keep track of different functions or to keep track of what you need to turn in. When your organization is not the best, it leads to errors in code and begins to test your communication skills. Because I did struggle with some of the projects, communicating with my professor was the best thing to do in order to fix the error or to learn about programming tips. Time management was the skill I lacked the most during this course because I got stuck with code - not able to get a project in by a deadline. I do believe I can improve my time management skills and most definitely will knowing this will help me in school, in jobs, and in life.

These skills align with my new mission statement by being a part of it. I think if everyone had a foundation of these skills, we could all improve our lives. If I focus on my own and how I can help others with these skills, a change for the better could occur. I struggled with some of the skills at first, just like many others do, and I am excited to help others overcome the challenges and see them through it while I continue to improve my own.

After taking this course, I have found out that I can challenge myself, I can succeed with challenges, and I can code. I did not believe I was going to make it through this course for some time when I struggled with some of the projects and deadlines. It was a challenge to move past those and put forth my best effort to be able to move on and make it to the end of the course. I did realize my time management or organizational skills were lacking support from myself as I juggled face-to-face classes, work, and an online course. I had only done a bit of programming in middle school being in the robotics club and doing online activities in computer class. This course showed me that I can go further with programming if I wanted to - now with a stronger foundation of the basics.

In Three Words

- Challenging
- New
- Invigorating
